Analiza kriminala i socio-ekonomskih faktora

Bruno Ćorić, Filip Škrlec, Jelena Matečić, Iva Zekić

11/6/2020

Učitavanje podataka

Imamo dva skupa podataka kriminala i socio-ekonomskih faktora za grad Chicago.

```
crimeDataset <- read.csv("crime_datasets/Crimes_-_One_year_prior_to_present.csv"
                         ,stringsAsFactors = F,na.strings = "")

povertyDataset <- read.csv("crime_datasets/Chicago_poverty_and_crime.csv"
                           ,stringsAsFactors = F, na.strings="")

head(crimeDataset)
```

```

```

Faktorizirat ćemo podatke koje bi bilo logično faktorizirati kao što su podaci u stupcu Arrest,Domestic.

```r
crimeDataset$ARREST <- as.factor(crimeDataset$ARREST)
crimeDataset$DOMESTIC <- as.factor(crimeDataset$DOMESTIC)
```

Provjeravamo fale li nam neki podaci u najbitnim kategorijama u oba dataseta.

```r
s <-c(1,2,3,4,5,6,8,9)
sum(is.na(crimeDataset[s]))
```

```
## [1] 0
```

```r
sum(is.na(povertyDataset))
```

```
## [1] 0
```

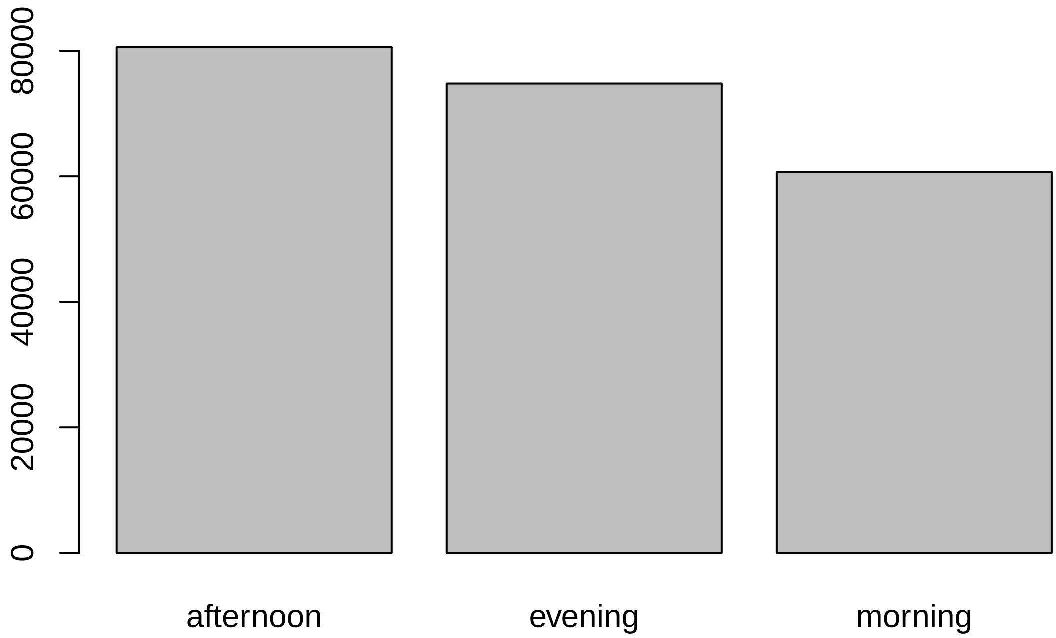
Razlika učestalosti zločina ovisno o tome koje je doba dana

Podijelit ćemo dan na 3 dijela. Od 5 do 13 će biti prvi dio dana. Od 13 do 21 drugi dio dana, a od 20 do 5 treći dio dana.

```r
timeOfTheDay <- mdy_hms(crimeDataset$DATE..OF.OCCURRENCE) %>% hour
timeOfTheDay <- sapply(timeOfTheDay, function(x) {
  if(x >= 5 & x < 13) {
    "morning"
  } else if(x >= 13 & x < 20) {
    "afternoon"
  } else {
    "evening"
  }
},simplify="vector")
timeOfTheDay <- as.factor(timeOfTheDay)
crimeDataset$TIME.OF.DAY <- timeOfTheDay
timeOfTheDayCount <- crimeDataset %>% group_by(TIME.OF.DAY) %>% tally
head(crimeDataset[c("DATE..OF.OCCURRENCE","TIME.OF.DAY")])
```

```
##      DATE..OF.OCCURRENCE TIME.OF.DAY
## 1 10/04/2020 08:31:00 PM     evening
## 2 08/26/2020 01:33:00 PM   afternoon
## 3 10/18/2020 03:50:00 PM   afternoon
## 4 02/05/2020 02:54:00 PM   afternoon
## 5 08/26/2020 02:19:00 AM     evening
## 6 04/09/2020 02:00:00 PM   afternoon
```

```r
barplot(table(crimeDataset$TIME.OF.DAY))
```



Napravit ćemo goodnes of fit test nad brojem kriminala koji se dogodio ujutro, popodne i navečer. Nulta hipoteza testa je da je očekivana proporcija 1/3 za broj kriminala u određenom dijelu dana, tj. da se ne razlikuje broj kriminala s obzirom na vrijeme.

```r
chisq.test(timeOfTheDayCount$n)
```

```
##
##  Chi-squared test for given probabilities
##
## data:  timeOfTheDayCount$n
## X-squared = 2909.8, df = 2, p-value < 2.2e-16
```

Odbacujemo nultu hipotezu i zaključujemo da da su proporcije različite.

Napravit ćemo test o homogenosti u kojem želimo viditi postoji li razlika u količini zločina s obzirom na doba dana.

Napravit ćemo test homogenosti u kojem ćemo provjeriti je li broj zločina opasnih po život jednak za sva 3 doba dana. Zločine koje smo uzeli da su opasni po život nalaze se u varijabli `dangCrimes`.

dangerousCrimes	Freq
dangerous	103354
less dangerous	112678

	dangerous	less dangerous
afternoon	36047	44524
evening	40592	34196
morning	26715	33958

```
##
##  Pearson's Chi-squared test
```

```
##
## data:  dangerous
## X-squared = 1904.6, df = 2, p-value < 2.2e-16
```

Zaključujemo da se razlikuje količina opasnih i neopasnih zločina ovisno o tome koje je doba dana.

Je li učestalost krađa veća od učestalosti kriminala vezanih za narkotike?

U varijablu 'description' odvajamo objekt PRIMARY.DESCRIPTION iz našeg skupa podataka crimeDataset. Zatim tu varijablu pretvara u skup podataka ali na način da se sve iste vrijednosti prebroje i upišu u stupaca Freq. U varijable krada i narkotici odvojimo podatke vezane za te zlocine. U varijable broj_krada i broj_narkotici zatim stavljamo sumu retka freq iz prethodnih varijabli.

```
description <- crimeDataset$PRIMARY.DESCRIPTION

description <- as.data.frame(table(description))

krada <- description[c(18, 28, 31),]
narkotici <- description[c(19, 23),]

broj_krada <- sum(krada$Freq)
broj_narkotici <- sum(narkotici$Freq)

cat("Učestalost krađa: ")
```

```
## Učestalost krađa:
```

```
broj_krada
```

```
## [1] 63083
```

```
cat("\n")
```

```
cat("Učestalost kriminala vezanih za narkotike: ")
```

```
## Učestalost kriminala vezanih za narkotike:
```

```
broj_narkotici
```

```
## [1] 8268
```

```
cat("\n")
```

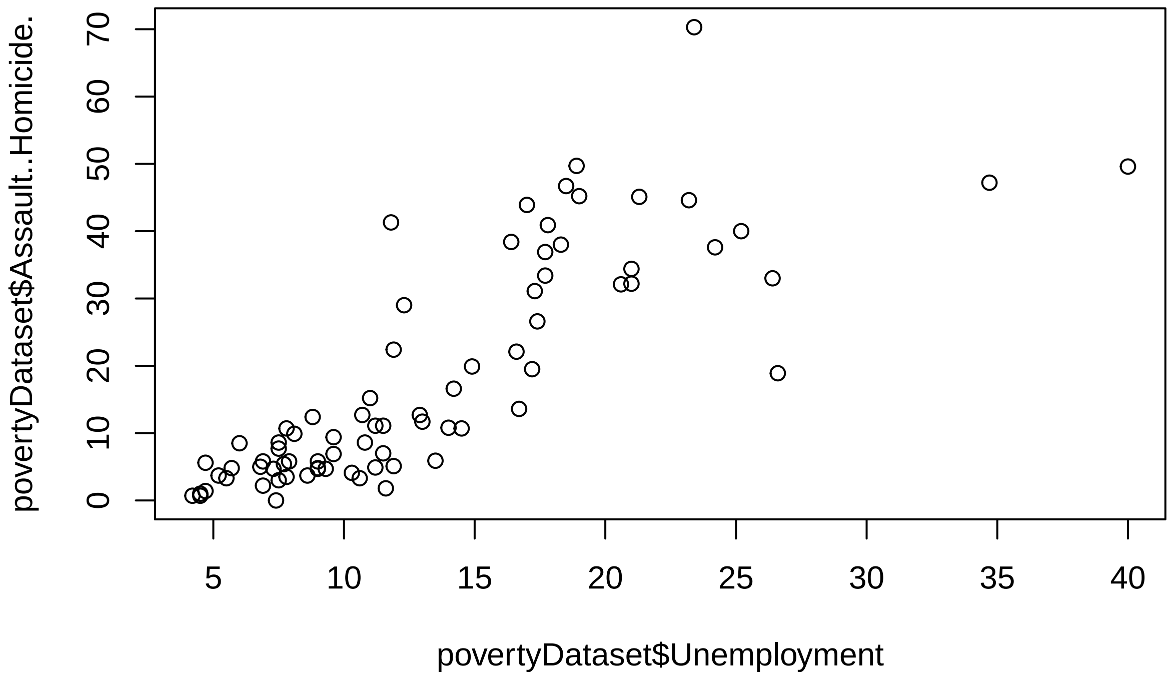
Veza između socio-ekonomskih faktora i pojedine kategorije kriminala

Ispitivati ćemo različite varijable koje bi mogle utjecati na "Assault Homicide" i "Firearm related" kategroije kriminala. Varijable koje ćemo promatrati su (postotci predstavljaju postotak broja stanovništva za određeni kvart): - postotak stanovništva koji su siromašni - postotak stanovništva koji žive u prenatrpanoj kući - postotak ljudi mlađih od 16 ili starijih od 64 koji su financijski - postotak ljudi bez diplome srednje škole - dohodak po stanovniku - postotak ljudi koji nisu zaposleni

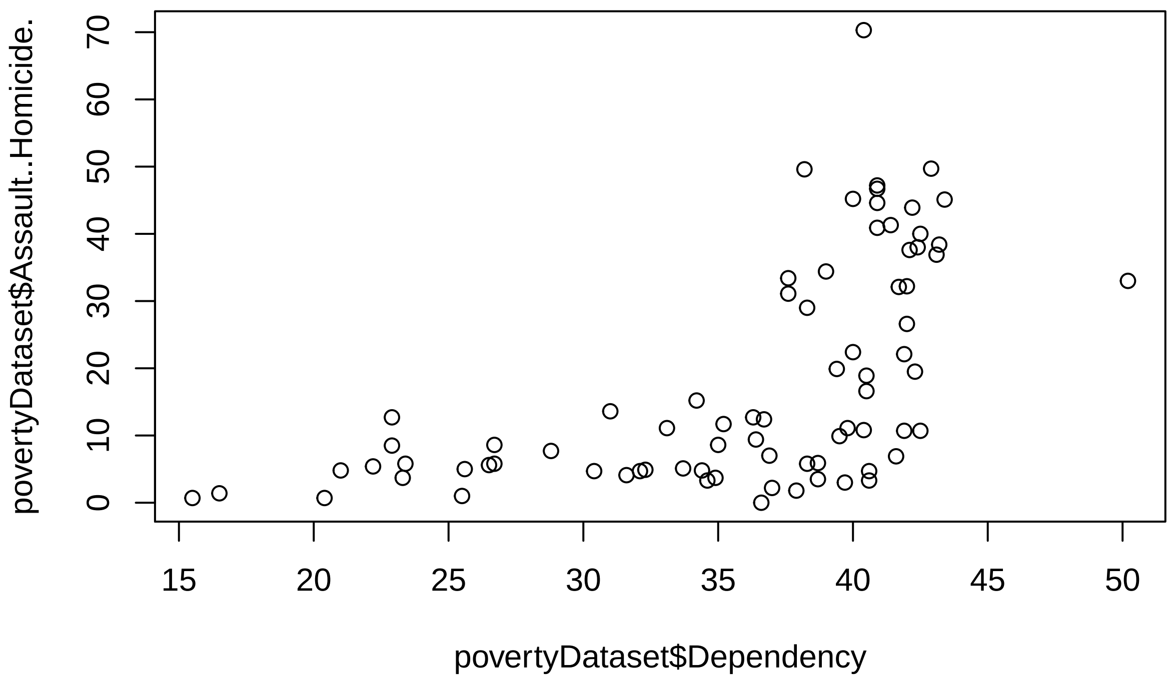
Nacratat ćemo nekoliko grafova kako bi dobili uvid u to kakav odnos imaju varijable.

Vidimo linearan efekt kod nezaposlenosti i siromaštva.

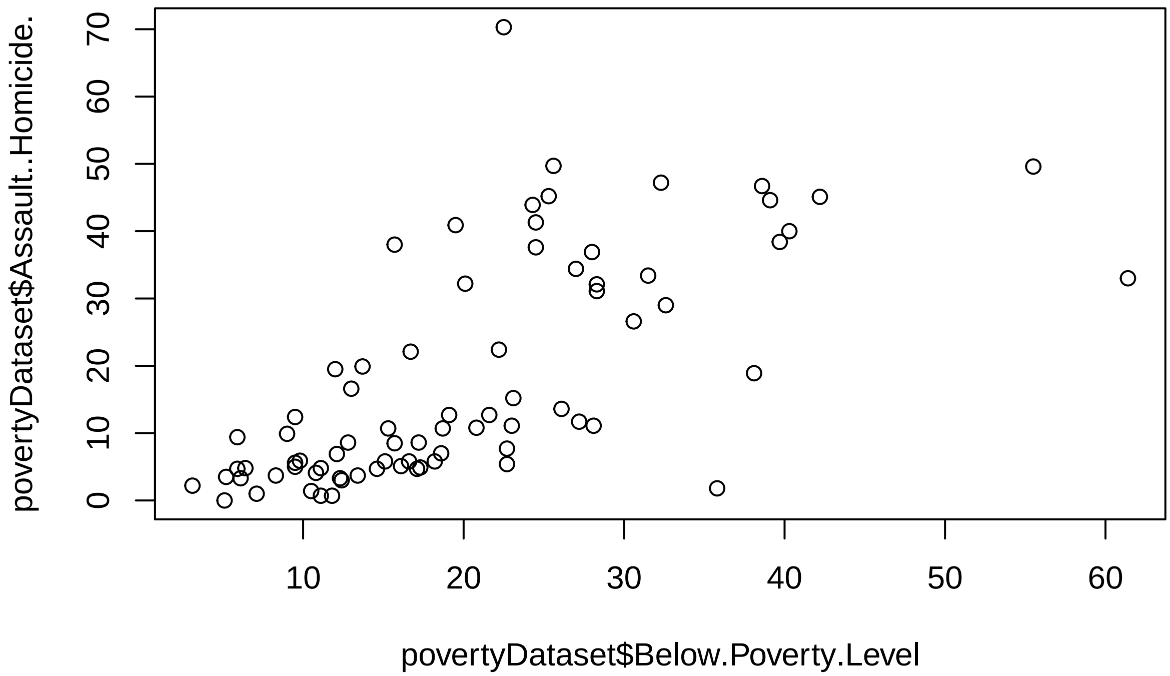
```
plot(povertyDataset$Unemployment, povertyDataset$Assault..Homicide.)
```



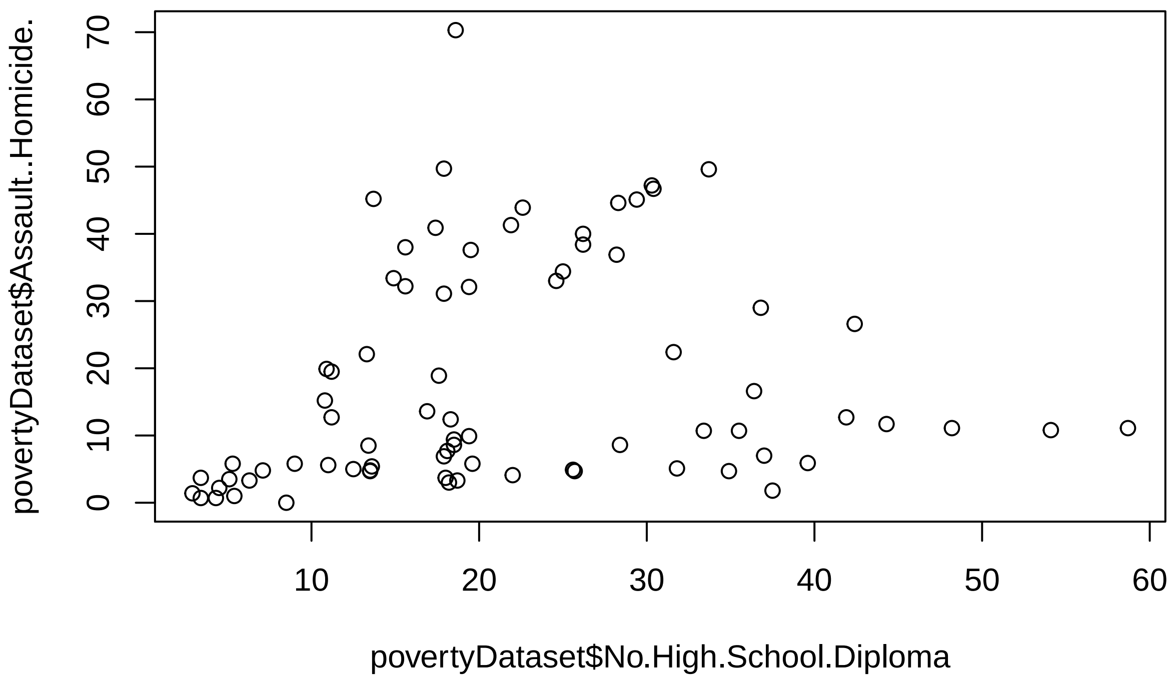
```
plot(povertyDataset$Dependency, povertyDataset$Assault..Homicide.)
```



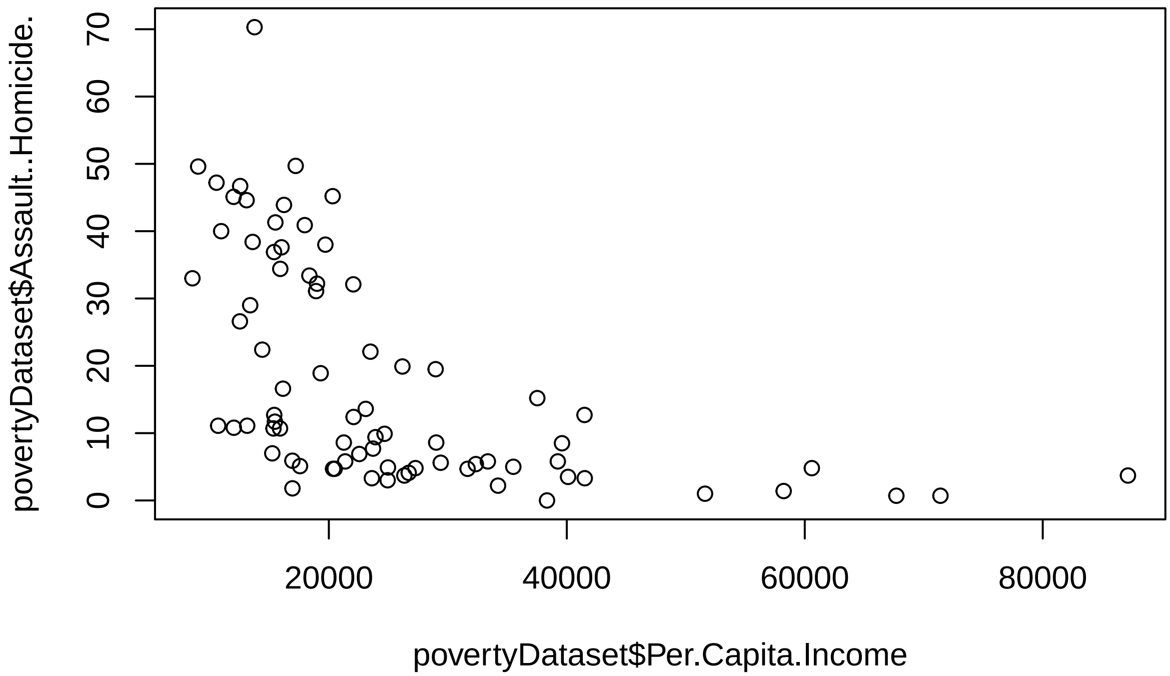
```
plot(povertyDataset$Below.Poverty.Level, povertyDataset$Assault..Homicide.)
```



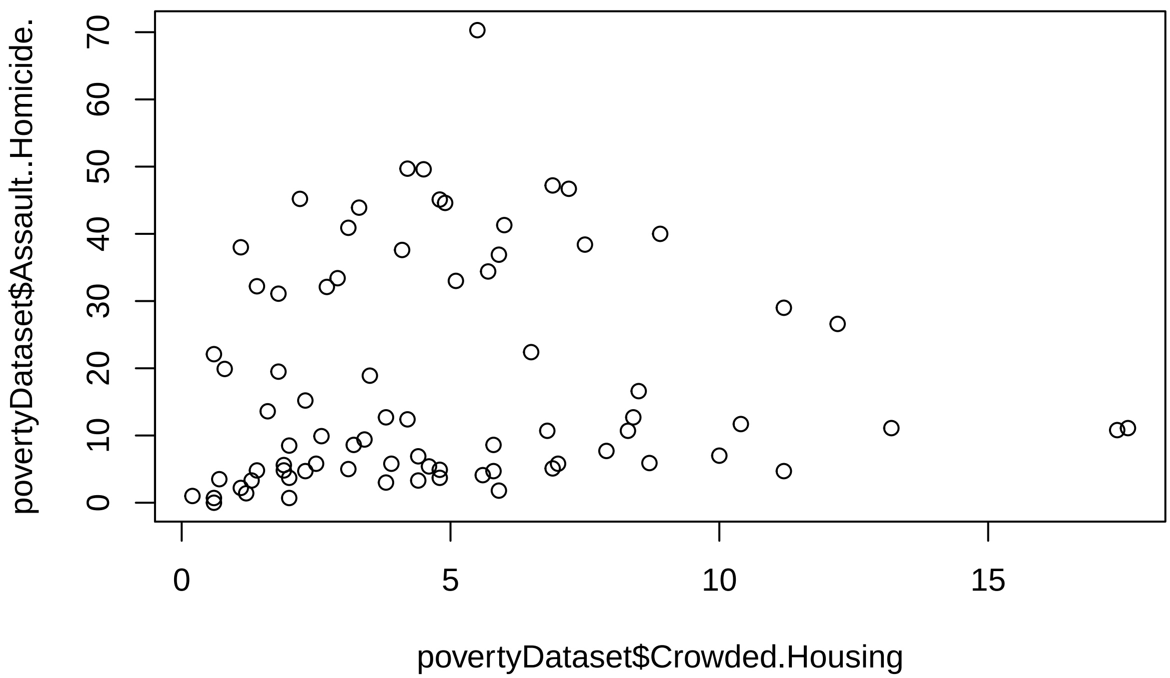
```r
plot(povertyDataset$No.High.School.Diploma, povertyDataset$Assault..Homicide.)
```



```r
plot(povertyDataset$Per.Capita.Income, povertyDataset$Assault..Homicide.)
```



```r
plot(povertyDataset$Crowded.Housing, povertyDataset$Assault..Homicide.)
```



Neke varijable su jako korelirane. Što je i bilo za očekivati.

```r
cor(povertyDataset$Firearm.related, povertyDataset$Assault..Homicide.)
```

```
## [1] 0.9671702
```

```r
cor(povertyDataset$No.High.School.Diploma, povertyDataset$Crowded.Housing)
```

```
## [1] 0.905274
```

```r
cor(povertyDataset$Below.Poverty.Level, povertyDataset$Unemployment)
```

```
## [1] 0.763817
```

```r
cor(povertyDataset$Dependency, povertyDataset$Per.Capita.Income)
```

```
## [1] -0.7565786
```

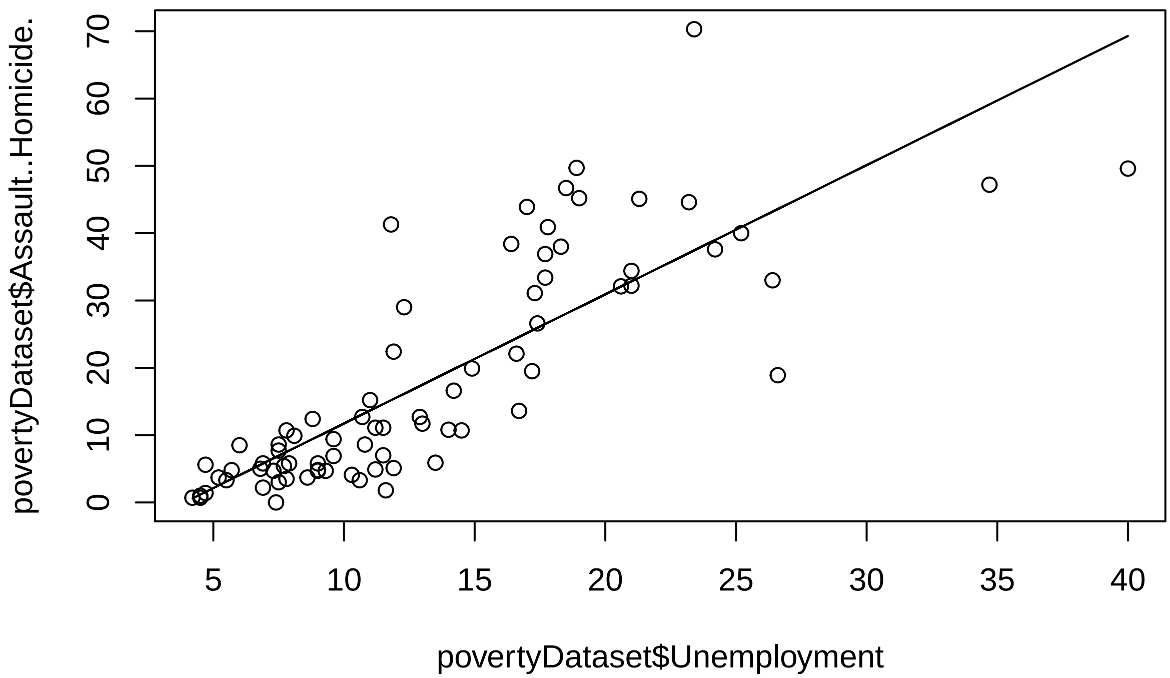
Jednostavne regresije

Izvodjiti ćemo neke zanimljivije jednostavnije modele.

Pošto su Assault Homicide i Firearm related jako korelirani, modeli za njih su jako slični.

Prvo procjenjujemo ubojstva pomoću varijable koja prikazuje nezaposlenost. Dobivamo mjeru kvalitete prilagodbe R^2 = 0.664 što je jako dobro za predviđanje sa samo jednom varijablom, a i očito je iz grafa.

```r
fit.AssaultUnemployment <- lm(Assault..Homicide.~Unemployment,data=povertyDataset)
plot(povertyDataset$Unemployment, povertyDataset$Assault..Homicide.)
lines(povertyDataset$Unemployment, fit.AssaultUnemployment$fitted.values)
```



```r
summary(fit.AssaultUnemployment)
```

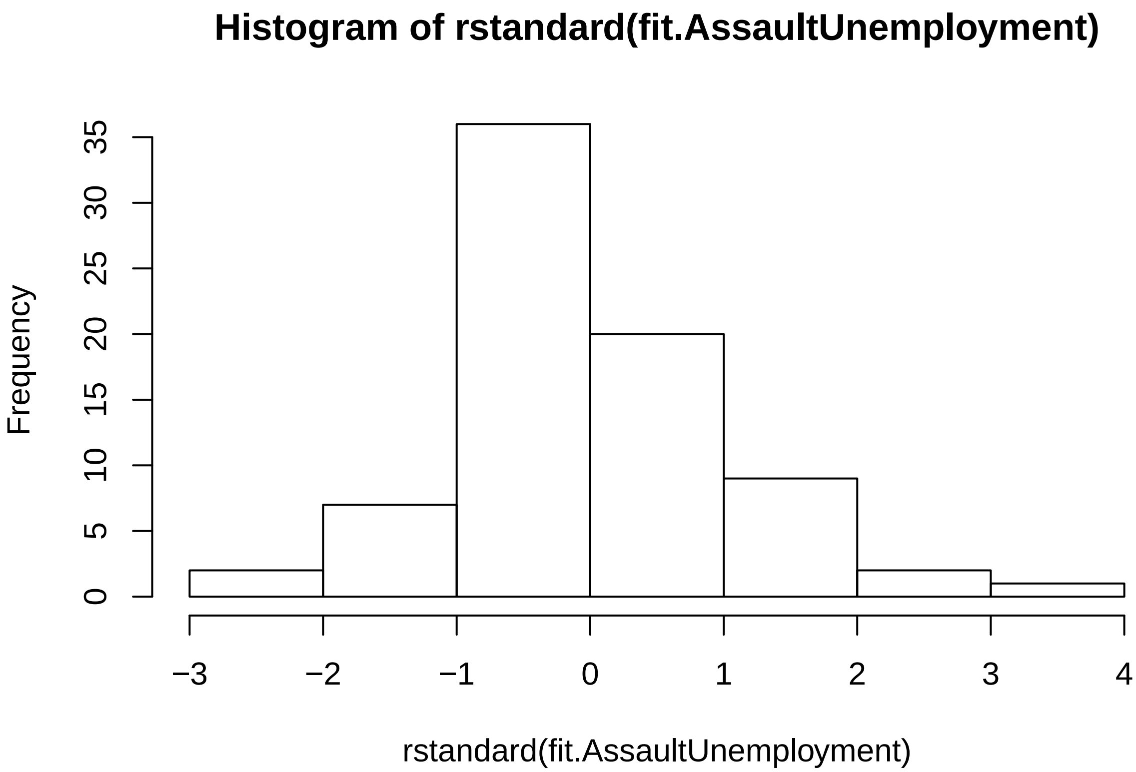
```
##
## Call:
## lm(formula = Assault..Homicide. ~ Unemployment, data = povertyDataset)
##
## Residuals:
##     Min      1Q  Median      3Q     Max
## -24.684  -5.110  -0.898   2.974  32.856
##
## Coefficients:
##              Estimate Std. Error t value Pr(>|t|)
## (Intercept)   -7.4617     2.3689   -3.15  0.00235 **
## Unemployment   1.9190     0.1576   12.17  < 2e-16 ***
```

```
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
##
## Residual standard error: 9.664 on 75 degrees of freedom
## Multiple R-squared:  0.664,  Adjusted R-squared:  0.6595
## F-statistic: 148.2 on 1 and 75 DF,  p-value: < 2.2e-16
```

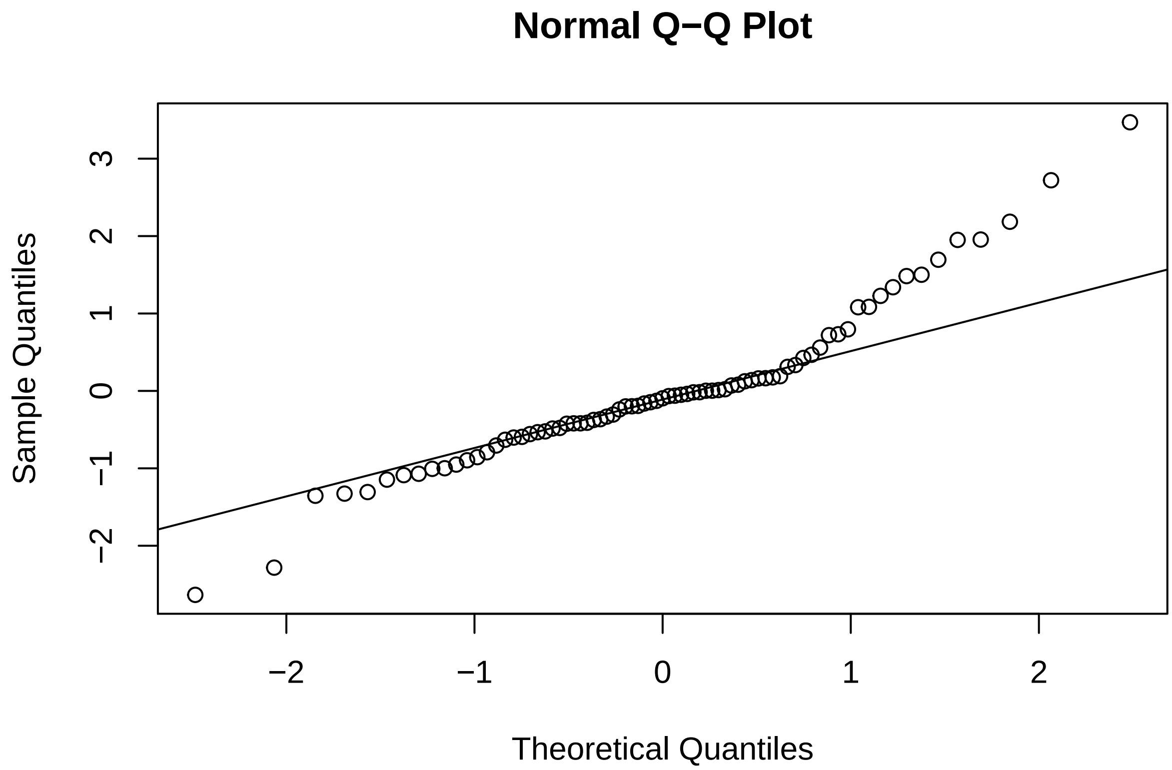
```r
ks.test(rstandard(fit.AssaultUnemployment), 'pnorm')
```

```
##
##  One-sample Kolmogorov-Smirnov test
##
## data:  rstandard(fit.AssaultUnemployment)
## D = 0.16491, p-value = 0.0268
## alternative hypothesis: two-sided
```

```r
hist(rstandard(fit.AssaultUnemployment))
```

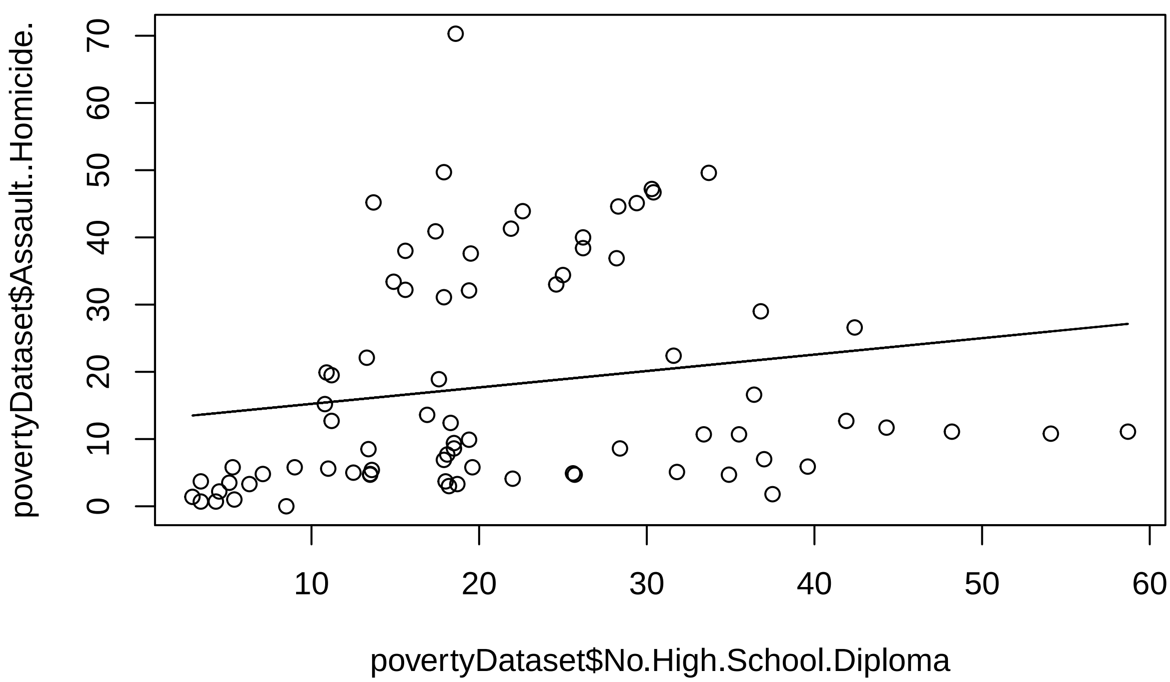


```r
qqnorm(rstandard(fit.AssaultUnemployment))
qqline(rstandard(fit.AssaultUnemployment))
```



Sada koristimo varijablu No High School Diploma. Uočavamo da reziduali nisu ni približno distribuirani po normalnoj distribuciji te je pretpostavka linearne regresije narušena što možda upućuje da nam treba neki složeniji model.

```
fit.AssaultDiploma <- lm(Assault..Homicide.
                         ~No.High.School.Diploma,data=povertyDataset)
plot(povertyDataset$No.High.School.Diploma, povertyDataset$Assault..Homicide.)
lines(povertyDataset$No.High.School.Diploma, fit.AssaultDiploma$fitted.values)
```



```r
summary(fit.AssaultDiploma)
```

```
##
## Call:
## lm(formula = Assault..Homicide. ~ No.High.School.Diploma, data = povertyDataset)
##
## Residuals:
##     Min      1Q  Median      3Q     Max
## -20.154 -11.916  -8.712  14.568  52.963
##
## Coefficients:

Višestruka regresija

Prije procjene modela višestruke regresije trebamo provjeriti jesu li varijable međusobno zavisne. Ako nemaju vrlo visoku korelaciju možemo ih koristiti zajedno u modeliranju. Već smo pokazali neke varijable koje imaju veliku korelaciju.

Kao što smo mogli očekivati nezaposlenost i siromaštvo objašnjavaju iste efekte u podacima te nećemo dobiti puno bolji model nego samo sa korištenjem siromaštva. Testirali smo i s drugim varijablama u kombinaciji sa nezaposlenošću i zaključili smo da

```
fit1 <- lm(povertyDataset$Assault..Homicide.~povertyDataset$Unemployment +
             povertyDataset$Below.Poverty.Level)
summary(fit1)
```

```
##
## Call:
## lm(formula = povertyDataset$Assault..Homicide. ~ povertyDataset$Unemployment +
##     povertyDataset$Below.Poverty.Level)
##
## Residuals:
##     Min      1Q  Median      3Q     Max
## -24.871  -4.487  -0.780   2.902  34.466
##
## Coefficients:
##                                    Estimate Std. Error t value Pr(>|t|)
## (Intercept)                         -8.0310     2.4306  -3.304  0.00147 **
## povertyDataset$Unemployment          1.7258     0.2441   7.069  7.3e-10 ***
## povertyDataset$Below.Poverty.Level   0.1548     0.1493   1.036  0.30334
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
##
## Residual standard error: 9.659 on 74 degrees of freedom
## Multiple R-squared:  0.6688, Adjusted R-squared:  0.6598
## F-statistic:  74.7 on 2 and 74 DF,  p-value: < 2.2e-16
```

Nakon izrade više modela sa varijablom nezaposlenost zaključili smo da nezaposlenost sama po sebi već jako dobro objašnjava podatke te kombiniranjem još s Dependency i No High School Diploma dobili smo najbolji model.

```
fit2 <- lm(povertyDataset$Assault..Homicide.~povertyDataset$Unemployment +
             povertyDataset$No.High.School.Diploma + povertyDataset$Dependency)
summary(fit2)
```

```
##
## Call:
## lm(formula = povertyDataset$Assault..Homicide. ~ povertyDataset$Unemployment +
##     povertyDataset$No.High.School.Diploma + povertyDataset$Dependency)
##
## Residuals:
##     Min      1Q  Median      3Q     Max
## -25.305  -6.327  -0.976   3.937  31.976
##
## Coefficients:
##                                        Estimate Std. Error t value Pr(>|t|)
## (Intercept)                           -16.06938    5.63459  -2.852  0.00565 **
## povertyDataset$Unemployment             1.76845    0.19372   9.129 1.07e-13 ***
## povertyDataset$No.High.School.Diploma  -0.18204    0.09695  -1.878  0.06443 .
```

```
## povertyDataset$Dependency               0.40587    0.19585   2.072  0.04177 *
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
##
## Residual standard error: 9.416 on 73 degrees of freedom
## Multiple R-squared:  0.6895, Adjusted R-squared:  0.6768
## F-statistic: 54.04 on 3 and 73 DF,  p-value: < 2.2e-16
```

Najbolje rezultate bez korištenja varijable nezaposlenosti dobivamo sa dolje modelom. Koristeći crowded housing nećemo dobiti bolji model jer već No High School Diploma opisuje taj efekt nad podacima.

```
fit3 <- lm(povertyDataset$Assault..Homicide.~ povertyDataset$Dependency +
              povertyDataset$No.High.School.Diploma+povertyDataset$Below.Poverty.Level
           + povertyDataset$Per.Capita.Income)
summary(fit3)
```

```
##
